

GE Microwave Blade Deicing

Spring 2017 Team: Curtis Brackett (MECL), Kathryn Liotta (MTLE), Steven Neyen (EE), Carlos Quintana (EE/MECL), Jacob Weidner (MECL), Christina Weis (MTLE), Joshua Whitney (MECL), Eli Zervigon (EE)

Introduction

- Wind turbine blades ice in cold climates
- Decreased efficiency (36%)
 - Increase mechanical loads

GE wants technical evaluation of microwave deicing option

Engineering Requirements

1) Microwave Generator Design

- Air Cooling
- Susceptor Materials
 - At least 50% microwave absorption
 - Add less than 1% to blade weight
- Antenna Design
 - 1-2kW/m² over 1m span at 4 m away
 - Radiation at ground level < 5mW/cm²
- Package Design
 - Package < 0.5m radial extent from tower
 - NEMA 4

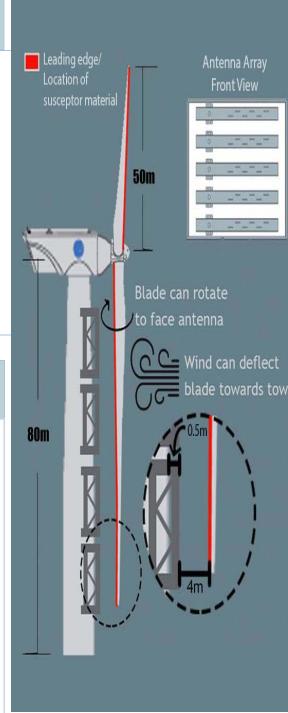

Background

- Blade and Ice do not absorb microwaves.
- Susceptor materials needed to absorb microwaves.
 - 50% + efficiency identified
 - Application method unidentified
- Heating of > 500 W/m² to deice in < 1 hour
- Magnetron preferred microwave source: cost, size
- Blade bends toward tower, limits module size
- Antenna needed to direct microwaves
 - Slotted Waveguide chosen to fit in module

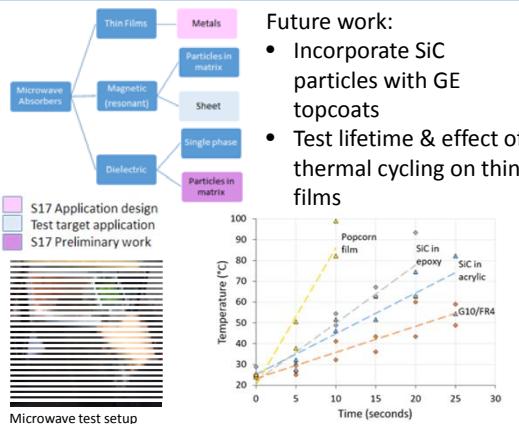

Semester Objectives

- Design test system to deice 1 meter blade section
- Microwave Generation – select microwave source and thermal management
 - Antenna – design to deliver 1-2 kW/m² microwave power 4m away
 - Package – design module for antenna array suitable for tower mounting
 - Susceptor Materials – identify materials and application methods

Provide insight to full scale feasibility

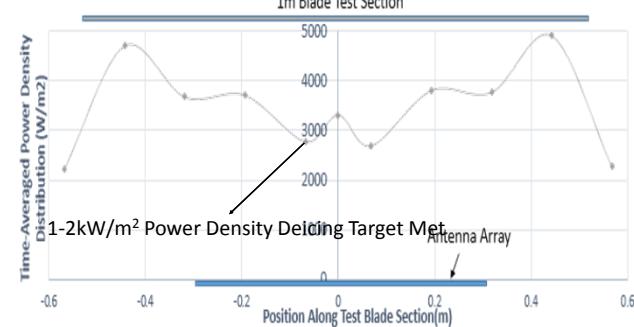

2. Susceptor Materials

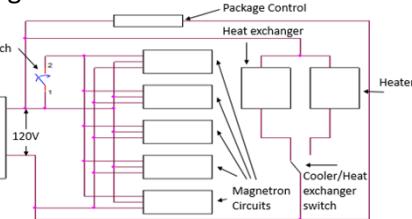

3. Antenna Design

ANSYS HFSS Simulation – Time Avg Power Distribution Along 1m Blade Section

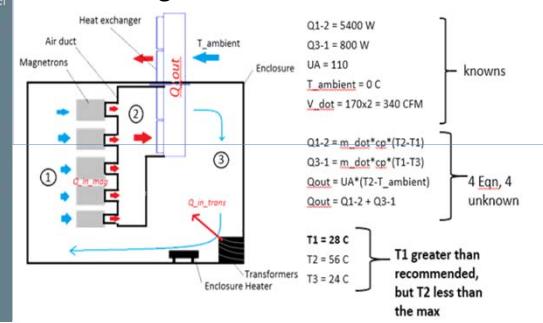

1. Microwave Generator and Cooling
